

foundations™

Foundations™ is a software development framework, toolkit and design methodology, developed by PDMS, to facilitate the development of high performance applications in Microsoft. Net.

We have created an expanding library of business components that are common to many different business systems. These slot into the Foundations™ framework and work alongside components developed to meet customer's specific business requirements. These tried and tested components cover a wide range of requirements from security and auditing right through to document management and publishing.

Foundations™ has been built to overcome the limitations of off-the shelf software, where one size doesn't really fit all, and the time and cost risks often associated with bespoke developments. Foundations™ allows us to deliver projects more quickly, saves our clients money and provides reliable and flexible software systems.

Visit our dedicated Foundations™ website to find out more about Foundations™ , what it can do and how it has been used to deliver successful software projects.
