

Hosting

PDMS provide fully managed application hosting services from dual data centres. One of which is operated by our partner Domicilium, a European tier-1 ISP, with state of the art hosting centres on the Isle of Man and in London

Our application management services have been specifically designed to optimize the performance and security of business critical applications which run over the Internet. This applies equally to conventional e-business applications and to internal business applications. Both can benefit from the additional performance, security and flexibility available from a professional infrastructure services company.

With our partners we offer a full range of hosting and infrastructure management services both in support of our own software developments and also, subject to technical architecture, for third party solutions or any combination of the two. In addition to conventional data networking we have considerable expertise and resources for voice and mobile network integration and can provide multi channel solutions making the best use of the full spectrum of communications technologies available.

One of the greatest benefits of a PDMS Foundations TM based application is the availability of a complete range of associated infrastructure services from full scale application hosting and management including built in disaster recovery (business continuity) capability to the provision of network design and security consultancy.

In addition to application hosting we provide a number of related services such as web usage statistics, access to payment processing facilities, postcode look up facilities and web positioning services.

Interested in our infrastructure services? Contact us to find out more about our facilities.
